

EIGHT

The Intervention Initiative: theoretical underpinnings, development and implementation

Rachel A. Fenton and Helen L. Mott

Introduction

The bystander approach to prevention of violence against women is predicated upon empowering bystanders to intervene in a positive, pro-social way upon witnessing an event that they recognise to be problematic. The intervention made has potentially powerful social effects: it sends a clear message to the culprit about the social unacceptability of their behaviour, while concurrently alerting other bystanders to the appropriateness of challenging it. Constant and reinforced messaging about the unacceptability of behaviour within communities can thus shift social norms as to what constitutes desirable behaviour. While this narrative appears instinctive, bystander programmes are multi-faceted interventions underpinned by complex and sophisticated theory. The growing evidence base, predominantly from the US, indicates the aptitude of bystander intervention for university settings, its potential importance and promise denoted by legal and funding requirements for US universities (Campus SaVE Act, 2013; DeGue, 2014).

Aware of the promise of bystander interventions from the developing evidence base, and of the work done by the National Union of Students (NUS) and Alison Phipps (for example NUS, 2011) in exposing the problem of violence against women in UK universities, in late 2013 Public Health England commissioned an evidence review of bystander intervention for this setting (Fenton et al, 2016), to identify best evidence and practice from which to develop a public health intervention toolkit for all universities to use for the prevention of sexual and domestic violence (SDV), which became *The Intervention Initiative* (Fenton et al, 2014, hereafter referred to as TII).

1 The creation of TII at the University of the West of England was
2 preceded by an intensive development period including the trialling
3 of existing resources with student focus groups, and extensive
4 consultation with an Expert Advisory Group (EAG) and a Student
5 Bystander Committee (SBC). Our EAG comprised national and
6 regional experts in SDV and our SBC was recruited from across the
7 university and comprised students of different genders, sexualities,
8 ethnicities, ages, years of study, disciplines and countries of origin.
9 TII was published online in 2014,¹ becoming the first evidence-based
10 bystander programme for the sector, and is available free of charge.
11 It is an eight-hour facilitated intervention designed to be delivered
12 to small groups over time. The research and programme have had
13 significant impact on the higher education sector. Within six months
14 of its publication, four government departments had written to all
15 Vice Chancellors asking them to look at implementing TII, and from
16 this point onwards – and particularly since Higher Education Funding
17 Council for England (HEFCE) catalyst funding was made available
18 with adherence to TII a condition of funding – a growing number of
19 universities are implementing it in various ways. The results from a full
20 statistical evaluation using a curriculum-based design with a cohort
21 of students, funded by Public Health England, are promising (Fenton
22 and Mott, 2017b). Student evaluations showed excellent self-report
23 learning outcomes (Fenton and Mott, 2015).

24 TII is predicated on bystander theories, social norms theory, the
25 criteria for effective prevention programming (Nation et al, 2003)
26 and Prochaska and DiClemente's (1983) transtheoretical model of
27 behaviour change (TTM) as applied to bystander intervention by
28 Banyard et al (2010). The TTM suggests that both communities and
29 individuals pass through several stages – from precontemplation or
30 denial of the problem, to contemplation or awareness of the problem,
31 to preparation or intending to take action, to actual action through
32 modified behaviour, and finally to maintenance or continued behaviour
33 change (Banyard et al, 2010). TII is thus a complex model designed to
34 have multi-faceted prevention capabilities, as illustrated by the theory
35 of change (in Fenton and Mott, 2017) which sets out the internal
36 processes participants will pass through to achieve behaviour change
37 and the intermediate and distal outcome measures designed to evaluate
38 this. TII aims to accomplish two core interwoven purposes in order
39 to engender a reduction in violence at the community level: first, that
40 potential bystanders will intervene to prevent problematic behaviours;
41 and second, that it operates strategically to change a number of the
42 attitudes, beliefs, social norms and peer group relationships which

1 facilitate perpetration and impede bystander behaviour (Fenton et al,
2 2016: 20).

3 As detailed analysis of the evidence base for bystander programme
4 is available elsewhere (Fenton et al, 2016; Fenton and Mott, 2017^a),
5 this chapter will concentrate particularly on the methodological and
6 pedagogical application of the evidence to each session of TII, its
7 overarching structure, and the relationship with the outcome measures,
8 in order to substantiate that TII may genuinely claim to be evidence-
9 based. This is important because in the current climate a multitude of
10 interventions which are not necessarily evidence-based, nor tested, are
11 available for the sector, some of which are marketed for a substantial fee.
12

13 **Evaluations of bystander programmes for university** 14 **settings**

16 There is a methodological difficulty inherent in using reduced
17 incidence of violence as the primary measure of success (see Fenton
18 et al, 2016: 40 for a discussion) and thus it is not surprising that for
19 bystander programmes rigorous evaluative/outcome evidence such
20 as randomised control trials is limited. However, Coker et al (2016)
21 do provide evidence of lower reported rates of victimisation and
22 perpetration at campus-level. Considerably more significant evidence is
23 available for proxy measures, such as decreases in rape myth acceptance,
24 sexist attitudes, perceptions of peer sexist attitudes, denial of violence
25 as a problem, actual and intended perpetration of violence, increases in
26 empathy for rape survivors, confidence and intention to intervene, and
27 knowledge about violence (see Fenton et al, 2016). These intermediate
28 outcome measures correlate with those risk and protective factors
29 which are agreed to be related to SDV victimisation and perpetration.
30 They are important for evaluating prevention likelihood when
31 incidence cannot be measured and additionally evaluate how and in
32 what way the programme is working as participants pass through the
33 necessary stages for intervening, as detailed later.
34

35 **The development of TII: bystander theories**

37 Perhaps the key to the promise of bystander intervention for this setting
38 is that its very ethos – becoming a positive pro-social bystander – is
39 intrinsically appealing, or at the very least, unobjectionable, and may
40 engage men. Prevention efforts have shifted away from addressing
41 men as potential perpetrators and women as potential victims which
42 created resistance and were not effective (Flood, 2006; Powell, 2011;

1 Berkowitz, 2013). Efforts now focus on situating responsibility for
2 ending violence within the community as a whole by engaging
3 everyone as pro-social bystanders (Berkowitz, 2013). The underpinning
4 approach of TII is thus the fostering of a *shared social identity* among
5 students as ‘students of X university’, which transcends other identities.
6 This does not diminish the importance of other social identities nor
7 mean that violence and abuse is not differentially experienced by
8 different individuals and groups but rather asserts that as ‘a student of
9 X university’ they will act to prevent violence against others in this
10 community.

11 In order to be able to act to prevent violence, bystanders must
12 complete the stages required to move from inaction to action, as
13 outlined by Latané and Darley (1970) in their organising framework
14 for understanding bystander behaviour. Thus a bystander must notice
15 an event, understand that it is problematic, decide that they are part
16 of the solution thus assuming responsibility for helping and, finally,
17 possess the skills to intervene effectively and safely (Banyard et al,
18 2009; Berkowitz, 2009; Powell, 2011). These four stages constitute the
19 skeleton framework of TII and also map particularly well onto the ten
20 processes of change of the TTM (Prochaska and DiClemente, 1983;
21 Banyard et al, 2010; for a summary table see Fenton et al, 2016: 22).
22 Of the eight hours of training which constitute TII, the first three
23 stages for intervention are covered in sessions one to five, and the skills
24 training (stage 4) is covered in sessions five to eight. The sessions are
25 detailed later.

26 27 **Sessions one to five of TII: from noticing the event to** 28 **assuming responsibility** 29

30 Noticing an event and interpreting it as problematic requires knowledge.
31 Although knowledge by itself is not sufficient to produce behavioural
32 change (DeGue et al, 2014), it is a crucial precursor to noticing a
33 problematic event and key to the consciousness-raising process of
34 the TTM. The knowledge required in the field of SDV relates to the
35 recognition of: the risk factors for victimisation and perpetration; the
36 impact on victims; behaviours along the continuum of sexual violence
37 (Kelly, 1987) (for example, everyday sexism, hostile attitudes towards
38 women, rape myth acceptance); the early warning signs of domestic
39 abuse; and potentially dangerous situations (Fenton et al, 2016: 17). An
40 increased sense of motivation or responsibility is essential to accompany
41 knowledge and can be fostered through increasing empathy for victims
42 (also a protective factor against perpetration), and through a gender-

1 transformative approach which engenders a critical understanding of
2 participants' own attitudes about gender equality and violence, such as
3 those manifested by rape myth acceptance. There is strong evidence that
4 bystander programmes are effective in generating positive attitudinal
5 changes, such as significantly reduced rape myth acceptance and sexism
6 and that knowledge, empathy, and attitudes and beliefs are related to
7 intermediate outcomes for programme success (see Fenton et al, 2016).

8 In line with this, TII explores bystander theory, relevance of SDV
9 to the student community, gender inequitable attitudes, empathy, and
10 facts about SDV in sessions one to four. It is here, in the noticing stage,
11 that deeper understandings about the intersection of social identities
12 and differential experiences of SDV can be fostered. These sessions
13 correspond with the consciousness-raising (information gathering),
14 dramatic relief (being emotionally moved, empathy), environmental
15 re-evaluation (understanding harms caused in the environment and
16 one's own role in this), social liberation (realising that it would be
17 liberating and empowering to be free of the problem), self-re-evaluation
18 (acknowledgement of previous unsafe practices), and stimulus control
19 (thinking of how to divert risks for problematic behaviour) processes
20 of the TTM (see Fenton et al, 2016: 31). As noted earlier, bystander
21 approaches seek to engage everyone as part of the community in
22 preventing violence and abuse. Engaging men has proven particularly
23 challenging because, in critically exploring gender roles, gender
24 equality and masculinity, men may perceive interventions as blaming
25 of men or labelling them as perpetrators (Casey et al, 2012). While
26 situating men as pro-social bystanders is an important and potentially
27 effective theoretical means to deflect defensiveness and hostility, the
28 content of any intervention must simultaneously be mindful of the
29 role of gender in violence perpetration and victimisation. This tension
30 between recognising that men are more frequently the perpetrators
31 of violence on the one hand, and not generating resistance on the
32 other will need to be constantly negotiated. The bystander framework
33 operates like a masquerade: what is seen and experienced by participants
34 is the outward guise of becoming a bystander – which is inclusive
35 and non-gendered – but underneath the mask the intervention is
36 acknowledging and addressing the gendered nature of violence, and
37 aiming to reduce actual and intended perpetration.

38 Following extensive consultation with our SBC, TII introduces
39 bystander theory in a neutral context (not related to SDV) to engage
40 participants' interest in bystander intervention as a social phenomenon
41 per se in the opening session of TII. In recognition of the importance
42 of the first session for student engagement and 'buy-in', the sensitivity

1 of the topic of SDV, and the importance of engaging men from the
2 outset, the session facilitates discussion and debate about students'
3 own previous bystander behaviour, and encourages the processing of
4 emotions about when and why they may, or not, have intervened and
5 the consequences of doing or not doing so. The session subsequently
6 introduces the extent of SDV within student communities as an issue
7 directly relevant for the participants for which participants can be 'part
8 of the solution' (Berkowitz, 2011, 2013).

9 Session 2 aims to shift attitudes supportive of gender based violence
10 (GBV) by critically exploring norms surrounding masculinity and
11 femininity, and gender inequality (the most commonly identified
12 attitudinal risk factor for men's violence against women; Ricardo et
13 al, 2011). In taking this gender-transformative approach, the input of
14 our SBC and further male student feedback was crucial in addressing
15 the engagement of male participants. Of particular note was the advice
16 not to mention feminism or use any words associated with feminism
17 perhaps because of the social undesirability and stigma associated (or
18 perceived to be associated) with the label 'feminist' (Roy et al, 2007).
19 While universities may offer young feminists spaces for engaging
20 with feminism and resisting sexism (Lewis et al, 2016), we were
21 mindful that TII needs to be applicable across the board and that some
22 disciplines are almost exclusively male-dominated. Thus for example,
23 we instruct facilitators not to use language that might be associated
24 with feminism but to wait for the language to come from participants
25 themselves. The session gives men space to explore and process how
26 they feel when confronted with the reality of GBV and with some
27 examples of 'lad culture' – which are used as a springboard to launch
28 discussion of male peer group behaviours. Facilitators are instructed
29 that maintaining positivity is crucial, and to reiterate throughout the
30 session that male participants are not being blamed for violence against
31 women and that most men do not perpetrate, and to emphasise that
32 men have a powerful role in ending other men's violence. The session
33 seeks to generate a critical understanding of the continuum of sexual
34 violence and the importance of intervening to prevent underlying
35 sexist behaviour within this. This is indicated because studies show
36 that college students may have trouble identifying 'low and no risk'
37 situations for intervention, be less willing to intervene to prevent
38 everyday sexist behaviour, and less likely to refuse to participate in sexist
39 activities not explicitly related to sexual violence (McMahon, 2010;
40 McMahon et al, 2011; McMahon and Banyard, 2012). We use a clip
41 from a UK television documentary *Blurred Lines: The New Battle of the*
42 *Sexes* (2014) which engagingly sets out the results of a psychological

1 study demonstrating the effects of sexist humour on the social attitudes
2 of sexist and non-sexist men. Although all sessions in the first half of
3 the programme work to increase empathy, session 2 also incorporates
4 a specific empathy exercise (adapted from Plante, 2002 in Banyard et
5 al, 2005) to enable participants to process the significant life changes
6 which might follow assault or abuse.

7 Sessions 3 and 4 explain the nature of SDV within the framework
8 of the first three steps of bystander intervention. We do not discuss
9 the low reporting rates for violence (descriptive norms) to guard
10 against discouraging reporting and encouraging a sense of impunity
11 on the part of any potential perpetrators. Presenting information
12 about injunctive norms is likely to be more effective, such as about
13 the strength of social disapproval of sexual violence (see Paul and Gray,
14 2011). Session 3 examines the law on rape and sexual assault in detail;
15 imperative for knowledge in order to be able to notice the event and
16 for consciousness-raising. We seek to draw participants' attention to
17 male sexual victimisation within a gendered understanding of sexual
18 violence. While there is only limited evidence that knowledge of
19 law may have some positive effect on behavioural intent (Withey,
20 2010) it is nonetheless an important component of the intervention.
21 From a criminological standpoint, a more definite understanding
22 of the behaviours which constitute criminal offences can increase
23 conditions for decreased motivation to perpetrate and increased capable
24 guardianship, including increased potential confidence to intervene
25 and the increased likelihood of reporting (Fenton et al, 2016). A good
26 example of this would be the recognition of behaviours now recognised
27 to be commonplace and normalised in UK student populations such as
28 unwanted groping (NUS, 2011) actually constituting a sexual offence
29 in criminal law (in this case a sexual assault under s.3 of the Sexual
30 Offences Act 2003). This session challenges, and seeks to reduce, rape
31 myth acceptance (RMA) which serves to legitimise sexual aggression
32 by men and downplay their responsibility for it, and is a predicting
33 factor for perpetration (McMahon, 2010). RMA is recognised in the
34 literature as an important attitude indicator and potential impediment
35 to bystander intervention (McMahon, 2010). RMA is important
36 not only as an attitudinal outcome measure per se but because lower
37 RMA is associated with lower denial (precontemplation) and increased
38 responsibility (contemplation) and action in the stages of change
39 (Banyard et al, 2010). McMahon (2010: 9) also found that those
40 students who endorse more rape myths are less likely to intervene as
41 bystanders. Reducing RMA is thus a potentially important component
42 in increasing bystander programme effectiveness. Law also serves

1 as a useful springboard; for example, examination of the law on
2 consent in this session facilitates wider discussion about what consent
3 means – particularly in circumstances of incapacity (such as through
4 intoxication) – and how it can be communicated.

5 This session brainstorms potential situations appropriate for
6 intervention by asking participants about the kinds of situations they
7 might now notice and in which they might be motivated to take
8 responsibility for action. One technique that TII adopts is to increase
9 recognition of the negative consequences for an offender, as men may
10 be more likely than women to intervene with perpetrators (Banyard,
11 2011). Thus TII aims to increase the responsibility and motivation of
12 men to intervene by suggesting that they can be a friend by stopping
13 a friend from ‘doing something stupid’.

14 Session 4 examines coercive and controlling behaviour in the many
15 forms that it can manifest, including stalking (a particular problem in
16 universities) and online abuse, within the bystander framework. The
17 session begins with an interactive empathy exercise scripted by a public
18 health specialist from our EAG. The exercise solicits an understanding
19 of what life would be like if they lived on an island controlled by a
20 dictator, the risks involved in planning to leave the island, and how
21 coercion and control can be subtly expressed. The session strongly
22 promotes the message that domestic violence can affect anyone
23 regardless of age, sexuality, ethnicity, gender, background and religion,
24 to increase inclusivity. It simultaneously ensures that understandings are
25 positioned against an awareness of the gendered aetiology, prevalence
26 and impact of domestic abuse. There is far less literature on the
27 application of bystander prevention to domestic violence and little
28 that evaluates prevention in universities. Coupled with the dearth of
29 quantitative data about domestic violence in student populations from
30 student surveys (which have concentrated far more on sexual violence),
31 the input of the **SAG {in full – or do you mean EAG?}**  national data became particularly important in designing this session.
32 Focus on recognising the early warning signs of domestic violence
33 was identified as key for this population, and as key for intervention
34 strategies. In order to combat resistance and to continue to engage men,
35 we consciously ‘de-gendered’ the early warning signs while ensuring
36 that students were nevertheless made aware of the very gendered
37 nature of domestic abuse. Key messages for participants centre on not
38 influencing a victim’s decision to leave a relationship and referring a
39 victim to specialist services (provided online and in a handout). The
40 session also seeks to dispel myths about the ease of leaving an abusive
41 relationship and fosters a non-judgemental approach. The technique
42

1 of understanding consequences for perpetrators, couched as ‘being
2 a friend’ (outlined earlier for session 3) is also adopted here in terms
3 of noticing, and being motivated to act against a friend’s problematic
4 behaviour towards a partner.

5 At this stage, participants should be assuming an increased willingness,
6 motivation and responsibility to act, in readiness for skills training in the
7 second half of the programme. It is also important to note that a further
8 outcome of these attitudinal and cognitive shifts for participants will
9 be a contemporaneous decrease in their own likelihood to perpetrate
10 violence (Fenton et al, 2016: 23) and this lends weight to the multi-
11 faceted theoretical promise of bystander approaches to prevent violence.
12

13 **Social norms theory** 14

15 Social norms theory can be integrated into bystander programming
16 to mitigate some of the barriers to bystander intervention (Berkowitz,
17 2009, 2013), and accordingly, is incorporated throughout TII. In
18 relation to bystander intervention, the mutually reinforcing interaction
19 of pluralistic ignorance and false consensus (Berkowitz, 2013) is key.
20 Pluralistic ignorance denotes the misperception of others’ desire to
21 intervene, which prevents intervention – which, in turn, leads the
22 wrongdoer to suffer from false consensus, the incorrect conviction
23 that others are like oneself when they are not (Berkowitz, 2009, 2013).

24 The social norms approach to behaviour change is a theory and
25 evidence-based approach aimed at correcting the misperceptions which
26 influence behaviour (Berkowitz, 2003, 2013). In this context, the
27 social norms concern norms which scaffold violence against women,
28 such as peer support for violence which can facilitate men’s violent
29 behaviour (Schwartz et al, 2001; 12; Gidycz et al, 2011; Berkowitz,
30 2013; Witte and Mulla, 2013) and misperceptions that inhibit bystander
31 intervention (Brown and Messman-Moore, 2010).

32 An understanding of social norms theory opens session 2 of TII
33 and here we introduce the emblem and logo of TII: the red and
34 green people, which denote, respectively, problematic behaviour and
35 healthy, positive behaviour. The emblem is used as an illustrative and
36 visual pedagogical device for understanding social norms and the
37 effects of positive intervention. The visual reappears in sessions 3 and
38 4 to demonstrate the connections between misperceptions of norms
39 and perpetration of SDV, and the negative link with willingness to
40 intervene, as evidenced in the literature. The emblem is intended to
41 be associated with social norms and trigger these associations whenever
42 they return throughout the programme. While we recognise that the

1 idea of red and green behaviours is simplistic and risks interpretation
2 as dividing society into 'good' and 'bad' people, rather than behaviours
3 exhibited by people which vary across time and situation, TII is
4 designed for all students regardless of academic background and our
5 SBC advised on the effectiveness of the design for understanding key
6 messages, particularly for students with no social science background.

7 Rather than rely purely on second hand messages about other
8 people's social norms misperceptions from reported studies, even
9 where participants were college students and therefore similar to TII
10 participants, it was theorised that maximal effectiveness is likely to be
11 achieved by correcting participants' own norms. Thus at the start of the
12 first session, students are asked to complete a social norms questionnaire
13 which asks questions relating to their own norms and their perceived
14 peer norms (of students of the same sex as themselves) about SDV
15 (Witte and Mulla, 2013). For example, participants are asked how likely
16 they would be, and how likely they think people in their peer group
17 would be, to 'Do something to help a very intoxicated person who is
18 being brought upstairs to a bedroom by a group of people at a party'
19 on a scale of 'not at all, rarely, neither likely/unlikely, likely, extremely
20 likely'. Direct feedback is given to students during session 5 about
21 their own misperceptions via slides which illustrate the percentage
22 differences between their own norm  individual questions and
23 their perceived  norms. The difference in these percentages is then
24 discussed and participants are invited to recollect the importance of
25 these misperceptions in terms of willingness to intervene. Participants
26 are shown that their misperceptions map onto those found by other
27 studies, evidenced in sessions 3 and 4. Again the red and green people
28 visuals are used to reinforce the social norms data. The critical message
29 for participants is that it is far safer to intervene than they thought: far
30 more people share their positive, healthy beliefs than they had thought
31 and they are therefore in the majority. Thus the facilitator is able to
32 correct the misperceptions of the social norm held by TII participants
33 and participants' barriers to intervention will be lowered.

34 35 **Sessions five to eight of TII: possessing the skills to act**

36
37 The final stage for being able to intervene to prevent violence is
38 possessing the requisite skills for safe and effective interventions in
39 a comprehensive array of situations. Assuming responsibility is not
40 sufficient: programmes that equip participants with situation-specific
41 skills for intervening are more likely to be successful (Banyard, 2011). A
42 perception of having a 'skills deficit' has been found to be a significant

1 barrier to intervention, particularly for women (Burn, 2009 cited in
2 Banyard, 2011) and thus confidence in one's skills and self-efficacy are
3 key. The literature indicates significantly increased efficacy (confidence
4 to intervene) scores for bystander intervention programmes (Banyard
5 et al, 2009). Thus, sessions 5 to 8 of TII are based on the acquisition
6 of relevant and specific skills, confidence to intervene and intervention
7 strategies and these sessions relate to the counter-conditioning
8 (acquisition of new skills to replace old strategies), social liberation
9 (realising that it would be liberating and empowering to be free of the
10 problem), helping relationships (social support for helping is available),
11 reinforcement management (social rewards for prevention behaviour)
12 and self-liberation (belief in own ability and commitment to carry
13 out prevention behaviour) processes of the TTM (see Fenton et al,
14 2016: 31). Participants are taught to strategise and consider relevant
15 intervention options for 'in the moment' interventions which require
16 very different skills to supportive interventions post-disclosure.

17 Session 5 begins the transition from didactic to experiential learning
18 by utilising a film from the New Zealand campaign 'Who are you?'
19 which is designed specifically for young adults to discuss who could
20 have intervened in a scenario which, devoid of intervention(s),
21 ultimately ends in the rape of an intoxicated young woman. The film
22 rewinds to show concrete examples of different potential bystanders
23 and their actions that could have prevented the rape. We then move to
24 exploring intervention strategies and introduce a chart derived from the
25 literature (Berkowitz, 2009, 2013) illustrating intervention methods,
26 which reappears through the next sessions. The work by Berkowitz
27 (2009, 2013) constitutes the mainstay of the teaching and theoretical
28 strategising on interventions, and in producing handouts with tips and
29 phrases and examples of interventions we have adapted best examples
30 from bystander programmes worldwide for UK language and contexts.

31 During sessions 6, 7 and 8, role play is introduced. The sessions
32 transition from reading already-scripted dialogue to participants
33 scripting their own. Role play develops communication skills and
34 research suggests that the very act of role playing may itself contribute
35 to opinion change in the direction espoused by the role play (Janis
36 and King, 1954). Role plays may also operate as a potential vehicle for
37 understanding intersectionality, such as the experiences of women and
38 men who identify as LGBT. The role plays thus constitute a multi-
39 faceted way of facilitating intervention. In session 6 we adopt a script
40 from a real-life scenario which is based on male-on-male violence,
41 both to ensure continued relevance to, and engagement of, men, and
42 because male participants are likely to have many opportunities to

1 practice bystander intervention yet concurrently be less committed
2 to intervening (Brown et al, 2014). The role play scenarios were
3 developed with extensive consultation with our EAG and an emergency
4 (999) phone call script was written for us by an Avon and Somerset
5 Constabulary call handler, and one script on disclosing a rape to a friend
6 was provided by a student rape survivor based on her own experience.
7 Many scenarios were provided by Somerset and Avon Rape and Sexual
8 Abuse Services. Thus authenticity was ensured. We also used scenarios
9 from existing programmes worldwide where they could be adapted
10 linguistically and contextually to suit a UK audience. The role plays
11 included in TII are a starting point and we encourage facilitators in
12 different parts of the UK to develop their own scenarios to reflect the
13 experiences of their own demographics and audiences and to further
14 explore intersectionality.

15 Crucial to the success of role play is that it reflects not only real-
16 life situations and contexts but is written in the language used by
17 participants (McMahon et al, 2011). Thus, once we had scripted
18 our scenarios to incorporate different intervention strategies and
19 techniques, they were re-scripted by our SBC into what they termed
20 (UK) 'student-speak', to ensure salience for our participants.

21 In addition to taking participants through the stages for bystander
22 intervention so as to effect internal change as described above, there
23 are several important features, which scaffold effective prevention
24 programming, to which TII adheres, as discussed in the following
25 section.

27 **Effective prevention programming criteria**

29 Successful prevention programming should adhere to the well-
30 established criteria for effective behaviour change set out by Nation
31 et al (2003). There are three categories: the characteristics of effective
32 prevention programmes; principles matching programme to target
33 population, and principles related to implementation and evaluation.
34 These categories and how bystander interventions should adhere to
35 them have been discussed elsewhere (Fenton and Mott, 2017^a). We
36 suggest that the criteria can be discussed under the broader terms
37 of pedagogy, and design and implementation. The criterion that
38 interventions should be theory-driven has been discussed in relation
39 to TII at length earlier.

1 *Pedagogy (sociocultural relevance, varied teaching methods and*
 2 *fostering relationships)*
 3

4 TII adopts a multiplicity of pedagogical techniques, such as presentation
 5 of material by facilitators via **on-screen slideshows** {**check this change**
 6 **is okay – PowerPoint is a specific piece of software and other**
 7 **presentation software is available (if less ubiquitous!)**}  role
 8 and smaller group discussion and group work, interactive exercises
 9 and role play skills training. We consulted extensively with our SBC
 10 on use of materials. Participant interaction is key as this in itself may
 11 result in social norms corrections as well as security in participation,
 12 the building of enduring relationships and the heightening of positive
 13 group norms. As visual and engagement aids TII uses a variety of
 14 YouTube clips, prevention videos, excerpts from documentaries, posters
 15 from prevention campaigns and the recurring emblem of red and green
 16 people, to reinforce messaging. Given that it is crucial for a prevention
 17 programme to be directly relevant to the lives of its participants, each
 18 session of TII utilises quantitative and/or qualitative data which are
 19 taken from UK student surveys to ensure that the problem of SDV
 20 is conveyed as proximal and salient to participants' lives and lived
 21 experiences, fostering a social norm that places responsibility firmly on
 22 them, as part of their community, to prevent violence. For example,
 23 in session 2, we use the testimony of a student (NUS, 2011) who
 24 was sexually harassed by a group of male students and then sexually
 25 assaulted by one of the group as a springboard to discussing male peer
 26 group norms and social identity, 'lad culture', empathy for the victim
 27 and escalation. Where possible we use YouTube and video clips that
 28 are in UK, as opposed to US, English and we adapted resources from
 29 the US into UK English. In addition, students also made their own
 30 motivational bystander film, which was filmed in various parts of the
 31 university in which students of a mix of genders, ages, ethnicities,
 32 courses of study and countries of origin talk about being an active
 33 bystander and pledge to be active bystanders. The film is played at the
 34 end of session 1 to facilitate motivation and 'buy-in' for the programme.
 35 While there are many such US films it was felt vitally important to
 36 script a specific culturally-relevant UK film with which participants
 37 could identify. TII also gives space to participants to air their feelings
 38 about the material by confronting any potential disconnect or resistance
 39 to ensure that the programme remains relevant to them. In session 2,
 40 when confronted with data evidencing the gendered nature of SDV,
 41 male participants are given space to talk about, and process, how they
 42 feel, whether they feel angry or annoyed or defensive or blamed so

1 that their feelings are acknowledged and reassurance can be given. This
2 space is of course also open to women to process their reactions to the
3 gendered nature of violence, as women may also be resistant. However,
4 at this precise point in the intervention, particular attention is paid to
5 men because if they feel blamed for perpetration, they may not return
6 to the programme. Women's resistance is unlikely to manifest as feeling
7 blamed. Discussing resistance is built in to the programme throughout.
8 For example, in session 3 when we discuss RMA and victim-blaming,
9 we address resistance using just-world theory and defensive attribution
10 theory – and examine how defensive attribution may operate differently
11 for men and women. The programme intends to create a 'safe' learning
12 environment where feelings can be acknowledged and discussed and
13 this is created not just by the materials but through the establishment
14 of 'ground rules' for the sessions at the start between the participants
15 and the facilitator which include how to talk about feelings, how to
16 respect each other and about confidentiality within the group.

17
18 *Design and implementation (comprehensive, dosage, timing, well-*
19 *trained staff and outcome evaluation)*
20

21 The evidence suggests that longer programmes appear to have more
22 impact (Banyard et al, 2007) and that single-session interventions 'are
23 not effective at changing behaviour in the long term' (DeGue, 2014: 1).
24 As a complex intervention TII thus requires time: TII is designed as
25 eight 1-hour sessions that can be delivered in this format or in others,
26 such as four 2-hour sessions, and delivered to small (mixed or same
27 sex) groups of seminar or tutorial size (10–25 participants) by (ideally)
28 the same facilitator per group to foster ongoing relationships. TII was
29 designed to be placed within student timetables and potentially feature
30 within curriculum design backed up by visible affirmative institutional
31 messaging about expected attendance. This model has been successfully
32 trialled (Fenton and Mott, 2015, 2017) at UWE and elsewhere.
33 We suggest that required attendance at all sessions is the preferred
34 approach in order to have the greatest reach, because those who need
35 to be exposed to the message may strategically evade attending (Rich
36 et al, 2010). However, we recognise that some institutions do not
37 mandate attendance and so institutions will have to decide on how
38 they implement in accordance with their own attendance rules, and, of
39 course, provide other options for victims/survivors who may feel unable
40 to participate. Institutions might make module credits available, for
41 example, when they cannot mandate attendance. The careful positive
42 and inclusive framing of TII is designed to deflect any resistance which

1 may be provoked by expected or required attendance. The programme
2 is cumulative and sequential, intended to be delivered at intervals, for
3 example, spaced out across semesters, thus repeating and reinforcing
4 the message over time. We suggest that maximal effectiveness will be
5 achieved by delivery from the very start of entrance to university in
6 order to set the tone for appropriate behaviour throughout students'
7 university careers.

8 The arguments as to whether interventions should be delivered by
9 peers or by professional facilitators/university staff have been discussed
10 elsewhere (Fenton and Mott, 2017^a).  strongly suggest that the use
11 of highly-skilled professional facilitators who have undergone disclosure
12 training is the appropriate university-led response because TII is a
13 complex intervention and facilitators must navigate the sensitive social
14 environments that the subject matter engenders.

15 A self-report learning outcome questionnaire is included in TII
16 for students to fill in anonymously at the end of TII. It includes 15
17 questions on learning outcomes and five questions on the structure
18 and flow of the programme (measured on a scale of 1 to 5), and space
19 for qualitative commentary on the programme and its facilitation.
20 This gives facilitators a good measure of how, and if, the programme
21 is meeting its learning objectives, its acceptability to students, and
22 facilitates ongoing review of the programme. This evaluation is
23 important for university managers and for sustainability. However, some
24 interventions are in fact harmful, achieving the opposite effect to that
25 intended (Hilton et al, 1998; Hilton, 2000; Flood, 2006) and thus any
26 potential 'backlash' – which may ultimately lead to a potential increase,
27 as opposed to decrease, in violence – must be assessed. Thus, in order
28 to measure the effects and success of the programme, a pre and post
29 evaluation using appropriate measures for attitudinal and behaviour
30 change should be conducted.

31 32 **Conclusion** 33

34 The introduction of fees and league tables have rendered students
35 consumers, and universities businesses. University reputation, student
36 recruitment, teaching excellence, graduate employability and the student
37 experience are high on the agenda for UK universities at the current
38 time. The introduction of an evidence-based bystander programme
39 aligns perfectly with this agenda. This is because lower perpetration and
40 victimisation levels should equate with less opportunity for reputational
41 damage to the university and more opportunity for an enhanced
42 student experience. Together with the acquisition of professional and

1 leadership skills in sessions 5–8 which support graduate employability
 2 and teaching excellence, these advantages of TII, if marketed correctly,
 3 could positively impact student recruitment.

4 The work done by activists, academics, journalists, the third sector,
 5 and latterly Universities UK and HEFCE in establishing tackling
 6 violence against women as a priority for universities has meant that at
 7 this moment in history UK universities are ready to act and resistance
 8 to acknowledging the problem for fear of reputational damage has
 9 been, for many senior managers, overcome. However, potentially
 10 effective programming, such as TII, costs time and money because
 11 there is no quick ‘tick box’ solution to violence against women. A
 12 strategy consisting solely of individual-level interventions, such as
 13 one-off workshops, cannot expect to make an impact on prevalence
 14 of SDV and, as the White House Task Force points out, ‘continuing
 15 to invest scarce resources in low- or no-impact strategies detracts from
 16 potential investments in more effective approaches and may be counter-
 17 productive’ (DeGue, 2014: 8). Although all the resources are free and
 18 available online as a public health intervention, TII nonetheless requires
 19 resourcing. The positive recommendation for bystander programming
 20 in *Changing the Culture* (Universities UK, 2016) refers to *evidence-based*
 21 bystander programming and thus senior managers should beware
 22 implementing programmes that cannot demonstrate a theoretical and
 23 pedagogical adherence to the research literature including the criteria
 24 for effective programming, and which have not been evaluated for
 25 negative effects.

27 Acknowledgements

28 We are grateful to our colleague Phil Rummey for his input into session 3 of TII.
